Annotation

The report discusses the objectives of sustainable development and emphasizes the importance of recycling as a means to achieve those goals. It highlights the need to raise awareness among society, particularly children from a young age, and inspire them to care for the environment.

Environmental education is crucial for adolescents to comprehend climate change, biodiversity loss, water and air pollution, and other global challenges of the modern era. These issues cannot be limited to mere theoretical knowledge.

One effective approach is to engage students visually by explaining concepts such as soil composition, river currents, and other relevant materials. Leveraging their visual memory allows them to deepen their understanding on the spot, without requiring extensive effort at home. By actively involving students, they become participants in the care for each other and their environment.

Moreover, I believe students should not only be encouraged to plant trees but also be responsible for nurturing and caring for them over a specific period. This hands-on experience with the saplings they directly plant fosters a sense of accountability and ownership.
